The role of the European Academy of Teachers in General Practice and Family Medicine in family medicine education in Europe – the experience of the University of Maribor

Zalika Klemenc-Ketiš, Janko Kersnik

Primary health care is important item of political agendas since Alma Ata conference in 1978. West Balkans share common history in development of primary care since 1920’ when Andrija Stampar introduced social and community based primary care concepts. The first known specialist training in general practice in the world started in former Yugoslavia in the early 1960’. Since then, much has been done in the field of general practice and family medicine and this is reflected in the European Academy of Teachers in General Practice and Family Medicine (EURACT), which is a network organisation within World Organization of National Colleges, Academies and Academic Associations of General Practitioners/Family Physicians Region Europe (WONCA Europe). Its aim is to foster and maintain high standards of care in European general practice by promoting general practice as a discipline by learning and teaching. EURACT developed several documents and teachers’ courses which can serve the development of family medicine curricula in new established departments of medical schools. This is also the case at Maribor Medical School, where learning outcomes and teaching methods are in concordance with EURACT teaching agenda, but also some innovative approaches are used, such as art and e-learning environment as teaching methods.

Key words: Family practice, Education, Europe, Slovenia.

Introduction

Primary health care is high on the agenda of all WHO countries in the world since Alma Ata conference in 1978 (1). We could say that we are again facing the same dilemmas as our colleagues were facing in the early 1920’, when in nearly identical circumstances prominent public health experts claimed the importance of equity, accessibility and affordability of preventive and curative medical interventions to the benefit of the whole populations, not only those, who were able to pay for it.

Short history of family medicine in Europe and former Yugoslavia

Andrija Stampar, World Health Organisation expert, was one of the leading minds in that time and had left the legacy in the form of integrated primary care institutions and the first known specialist training in gen-
eral practice in the world, which started in
former Yugoslavia in the early 1960’ (2, 3).
With the rare exceptions (4) primary care
as the basis of health care service delivery
still remains only a popular phrase in politi-
cians’ public speeches and dialogues. One of
the key persons in today public health care
discussions was Barbara Starfield, who suc-
cceeded to provide studies on importance of
primary care and family practice (FP) (5).
She claimed that an orientation to primary
care reduced socio-demographic and so-
cioeconomic inequities in access to health
services and in population health. FP has to
deliver evidence based care and has to serve
its patients as the first contact with health
care services, its population as the compre-
hensive service from promotion of health to
palliation of the incurable diseases and its
nation as the most rational use of the avail-
able resources. FP has its unique task profile,
which cannot be assumed as a simple addi-
tion of the task profiles of other disciplines
taught in Medical Schools (6-8). European
Union Directive demands from that mem-
ber states must introduce specialty training
in family medicine of minimum 3 years du-
ration (9, 10). An important contribution to
this is traditional social dimension of health
care systems in the countries established
from Former Yugoslavia (3, 11).

Development of EURACT

General practice/family medicine is prob-
ably the only medical discipline, which
spends so much time on defining its field,
boundaries, competences and task profile
(12, 13). Partly, this can be ascribed to the
fact that once upon a time there was only
one medicine existed – general medicine,
which cared for the patients in a holistic,
comprehensive, community oriented and
ethically correct way. By extraction of many
specialist branches, the discipline floated on
the surface of the second part of 20th cen-
tury’s events. The European Academy of
Teachers in General Practice and Family
Medicine (EURACT) is a network organisa-
tion within World Organization of National
Colleges, Academies and Academic As-
soociations of General Practitioners/Family
Physicians Region Europe (WONCA Eu-
rope) WONCA Region Europe – ESGP/FM
and was launched in March, 1992 to support
teachers in FP to provide the best care for
the populations. The establishment of the
European Academy of Teachers in General
Practice can be traced back to the formation
of the first Leeuwenhorst Group in 1974.
This group acted as a workshop for devel-
oping new ideas on the teaching of general
practice, and is remembered for defining
the role of the general practitioner and this
definition remains valid today. Its successor
was the New Leeuwenhorst Group, which
was formed in 1982 and was concerned with
the further development of general practice
as a discipline by teaching and learning. The
overall aim of the EURACT is to foster and
maintain high standards of care in European
general practice by promoting general prac-
tice as a discipline by learning and teaching
(14-16). EURACT has developed a defini-
tion of general practice (17), which was ad-
opted by WONCA, and already served as
a basis for the development of educational
and research agenda (18-20).

Basic medical education

In Medical Schools at university level, fam-
ily medicine is taught in almost all European
countries with the established Departments,
and sometimes also in the Medical Schools
without department of general practice.
The curricula are sometimes organised only
as residency programmes in general prac-
tice following basic medical education, but
mainly as a separate subject during the main
medical curricula. The absence of some
form of teaching about general practice in
basic medical education (BME) is in Europe merely an exception to the rule. According to the definitions of the profession, family medicine has a lot to offer to the common knowledge and skill base of Medical Schools’ students (21). The students can learn important concepts, which they can use in their future medical careers, i.e. communication skills, primary care approach, community orientation, working in the community settings, etc., and cannot be taught during other curricula. They can learn the provision of health care directly from the primary care practices, communities, visiting nurses and other primary care providers.

**Specialist training**

Specialist (vocational) training for general practice has become a rule in the majority of European countries (22). Several options are in place on how to provide “in service training” for those already working in general practice and how to retrain physicians from other specialties to practice as family doctors. Developed countries are taking the lead in designing the curricula which should reflect the needs of their populations (23). A special task force group in EURACT is working on Performance Agenda based on European Definition and Educational Agenda. Canada (24), USA and Denmark have some advances in this field, which will be incorporated into the final EURACT document.

Other important areas are selection of candidates for trainees and selection of trainers and training practices. Also in this field, EURACT acts proactively in providing guidance to governments and other responsible bodies (19, 25).

**Continuing medical education**

Continuing medical education was traditionally regarded as a key feature in quality assurance. There is a wide variation in recertification, continuing medical education (CME) and continuing professional development among the European countries (26). Recently, there was a shift from large CME activities towards small group learning, individual learning plans and use of modern technologies, which enables more personalised approach to learning. In the universities the selection of teaching methods and the pedagogic (i.e. teaching) competences of the teachers are often neglected, emphasising mainly research achievements of the candidates. Traditionally, the curricula depend on classroom lectures and direct observation of practice based activities instead on the advanced methods, which take into the account students’ learning cycle. However, family medicine departments are on the lead in teaching and using modern methods (21). In order to prove themselves they also use and spread new methods among the rest of the faculty, therefore improving the whole teaching process in Medical Schools (27).

Besides exchange of the experiences, reports (22, 25) ideas, educational materials, EURACT produces documents (17-19, 23), and different levels of courses for novice, proficient and expert teachers to fill this gap (28). Similarly, international course on assessment in medicine is aiming at the educators at undergraduate and postgraduate level and wants to deliver basic knowledge and skills in modern assessment methods. EURACT – “Bled” course teaching the teachers, which started in Slovenia in 1992, holds a special place amongst EURACT courses. Each year we deal with a new theme important for general practice, for example community orientation, communication skills, patient empowerment, medical ethics, quality assurance, practice management, etc. (29).
Teaching family medicine at Maribor University in Slovenia

Curriculum
At the Maribor University, undergraduate study of medicine lasts for six years. Family medicine is taught in the fourth and sixth year of study (seventh and 11th semester). Main themes, included in the curriculum of both semesters correspond to key features of family medicine (Box 1).

Box 1. Main themes in the curriculum of both semesters in Maribor Medical School.
- Use of clinical knowledge in early clinical exposure
- Doctor-patient communication and relationship
- Community orientation
- Practice management

Learning outcomes
During family medicine programme (both in fourth and sixth year of study), students are expected to gain knowledge, skills and attitudes (Table 1), which are in concordance with EURACT teaching agenda (18).

Teaching methods
The curriculum of family medicine consists of lectures, seminars, and exercises. While lectures and seminars are well-defined methods and allow little modifications, appropriate teaching methods as defined in EURACT educational agenda (18) are employed during exercises. Teaching methods are in correlation with learning outcomes (Table 1).

Lectures
Lectures take place only in the fourth year of study. Because they are regarded as having low educational value (30), but are an obligatory part of family medicine curriculum due to Maribor Medical School’s rules, other teaching methods are applied during lectures. These are discussions, buzz-groups, and reflections. Also, lectures are interactive and based on real clinical cases. These methods give additional educational value (31) to lectures and enable students to participate actively.

Seminars
Students in both study years must write an essay and present it orally in front of their colleagues and teacher, which is followed by a discussion, lead by a teacher. Forth-year students choose a theme (usually a common medical problem or disease) and write about it from an angle of primary care approach. The structure of such essay is in form of a review article. Sixth-year students choose a real patient case during clinical work in family medicine practice. They are encouraged to choose patients with common medical problems or diseases as well. The structure of such essay is in a form of a case report, a part of which is also a clinical question, posed by students themselves. They should answer it on the basis of evidence-based medicine (32). Other teaching methods, employed in seminars, are literature search, reading, and writing.

Exercises
Exercises consist of learning about family and family dynamics, learning about primary care approach, learning about communication, learning about house visits, solving problems in virtual practice, ordering laboratory tests, ordering physical therapy, skills training on models, working in clinical practice under tutor’s supervision, and field work. During exercises we use following teaching methods: clinical work in clinical practice under supervision, interactive learning, observation, reflection, role playing, project work, skills training, and study visit.

Assessment methods

Assessment methods correspond to learning outcomes and teaching methods employed (Table 1). We use both formative and summative assessment (33).

During family medicine programme in the fourth year of study, students are formatively assessed by teachers during several course units: written and oral presentation of an essay, written and oral presentation of
chosen family, communication assessment (video clip of role playing), solving problems in virtual practice, and skills assessment (MEQ analysis, work in clinical practice settings, clinical skills, field work project report, report about an educational movie). Each course unit is then summatively assessed by teachers on a 6-point Likert scale (0 – unsatisfactory, 5 – excellent). Final mark (summative assessment) is calculated from all course units’ scores.

During family medicine programme in the sixth year of study, students are formatively assessed by teachers during several course units: written and oral presentation of a case study (essay), assessment of working in clinical practise settings, assessment of working in nursing home, and assessment of knowledge about health legislation. Each course unit is then summatively assessed by teacher on a 6-point Likert scale (0 – unsatisfactory, 5 – excellent). At the end of the family medicine course in the sixth year of study, students must pass a written exam, which consists of 50 MCQ questions. Final mark (summative assessment) is calculated from all course units’ scores and score from a written exam.

Teaching materials (sources)

Family medicine education on Maribor University is based on three textbooks (34-36), written by teachers at the Department of Family Medicine. Each year, we also publish new editions of instructions for teachers (37), instructions for students (38) and instructions for essays’ writing (39).

Other teaching materials (articles, examples of books, forums, e-modules) can be found at e-learning environment Moodle (40) and at the Department of Family Medicine Maribor’s web page (41). These pages are regularly updated.

Educational research

Teachers at the Department of Family Medicine in Maribor are also interested in educational research, mainly from the field of new teaching methods. One of such methods, successfully implemented in the teaching process, is using movies in medical education. Movies present developed scenarios and are a form of controlled environment, which enables reproducible, focused and independent student learning. Through art, students are able to understand patients in their whole context (42).

The controlled environment of movies successfully enables students to explore their values, beliefs, and attitudes towards features of professionalism without feeling that their personal integrity had been threatened (27).

Conclusion

The development of family medicine as part of primary care approach in West Balkans has a long tradition. European academy of teachers, a WONCA Europe network organisation developed several documents and teachers’ courses which can serve the development of family medicine curricula in new established departments of medical schools which is also a case at Maribor Medical School. Here, learning outcomes and teaching methods are in concordance with EURACT teaching agenda. Also, some innovative approaches are used, i.e. using art in teaching holistic approach to patients and using e-learning environment for students’ project and communication.
